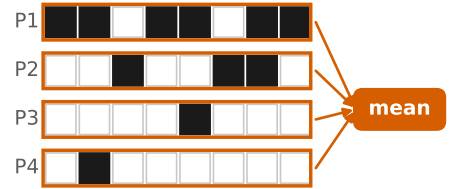
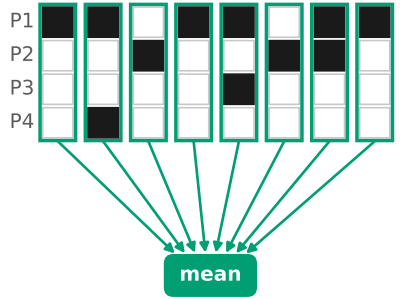
1 Per patient: when?



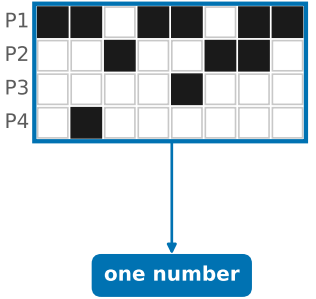
score each row, then average:
which of my days are risky?

2 Per time point: who?



score each column, then average:
which patient is at risk now?

3 Pooled



score all cells at once: most pairs
share neither patient nor time

In three clinical cohorts, 95-98% of the event/event-free pairs behind a pooled AUC shared neither the patient nor the time point.

Score 1 and 2 separately for the use at hand; 3 alone cannot show either ability.
